

Worksheet: Security Tasks, Patterns, and AI/ML Fit

Use this worksheet during Topic 06 Discussion 1. The goal is to identify cybersecurity tasks, connect them to the closest AI/ML application pattern, and sketch classroom activities that help students reason about fit, limits, and security consequences.

Instructions

Work in a small group. Generate cybersecurity tasks from your own teaching or professional context. Choose 2-3 examples, name the closest application pattern, and classify each task as a strong fit for AI/ML, possible with constraints, or poor fit for AI/ML.

For each task, identify the AI/ML role, the classroom use, and the guardrail or human review that would keep the example grounded.

Security Task	Pattern Label	AI/ML Role	Fit	Classroom Use

Reflection

- Which task was the strongest AI/ML fit, and what evidence supports that choice?
- Which task looked tempting but had constraints that would make AI/ML risky or ineffective?
- Which pattern label was the closest match, and what did that label reveal about the classroom use?
- What short in-class activity could help students evaluate the task and its tradeoffs?
